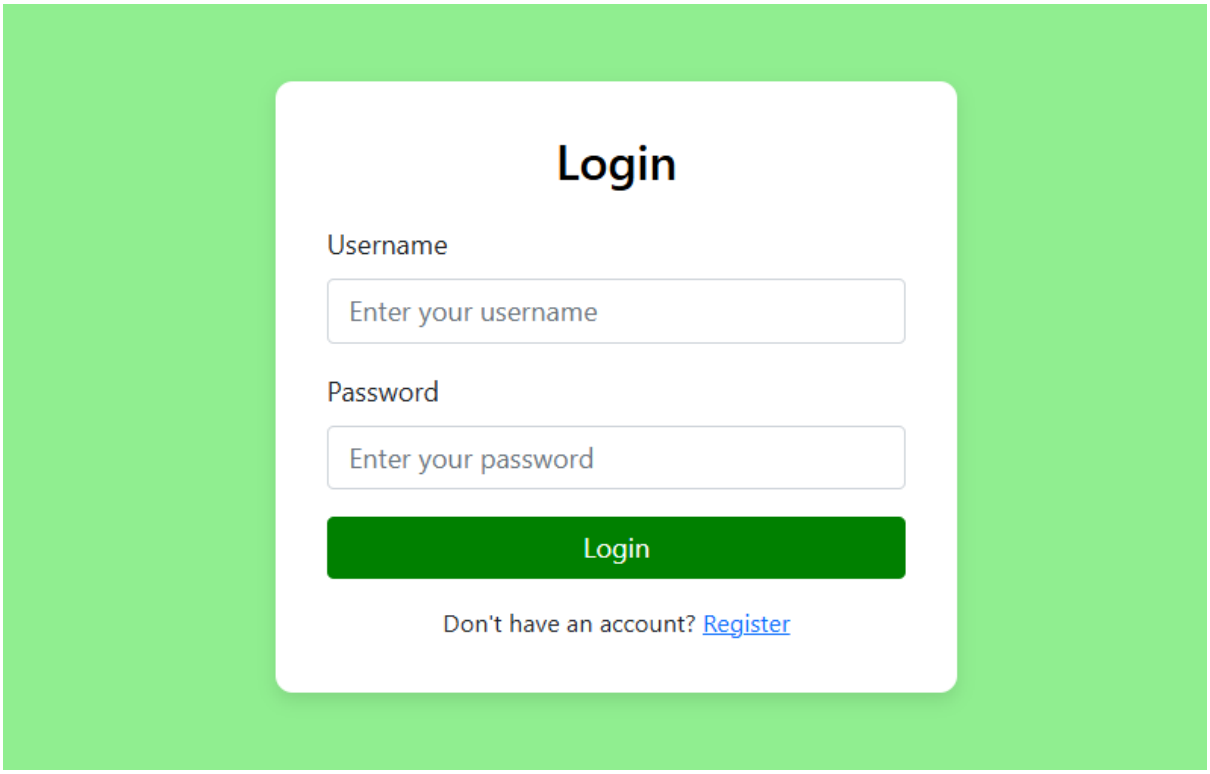
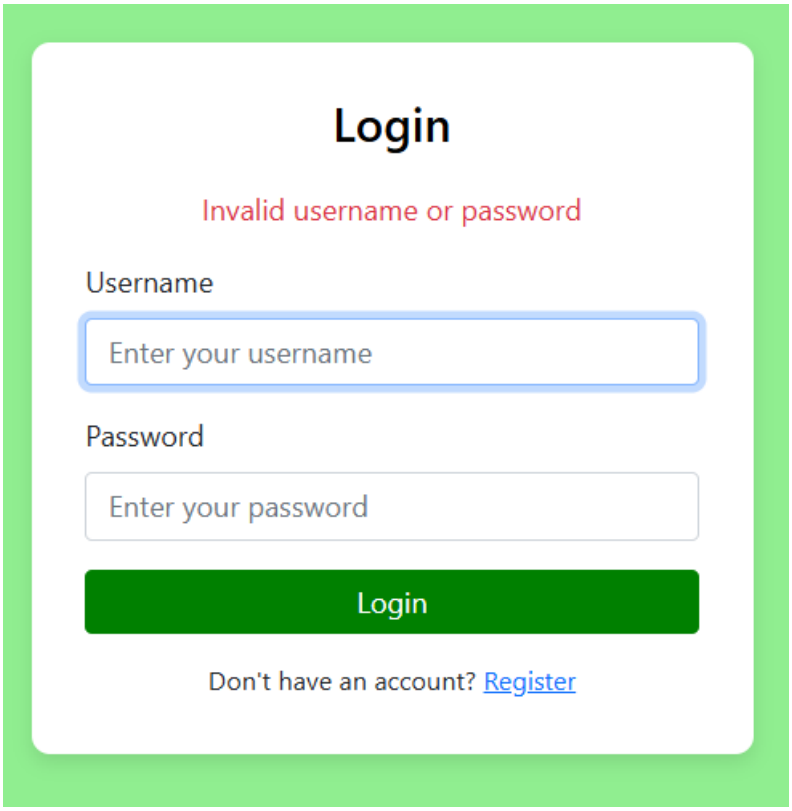
Login Interface

The admin needs to log in with username and password correctly so that they can access to the info of the user in the system

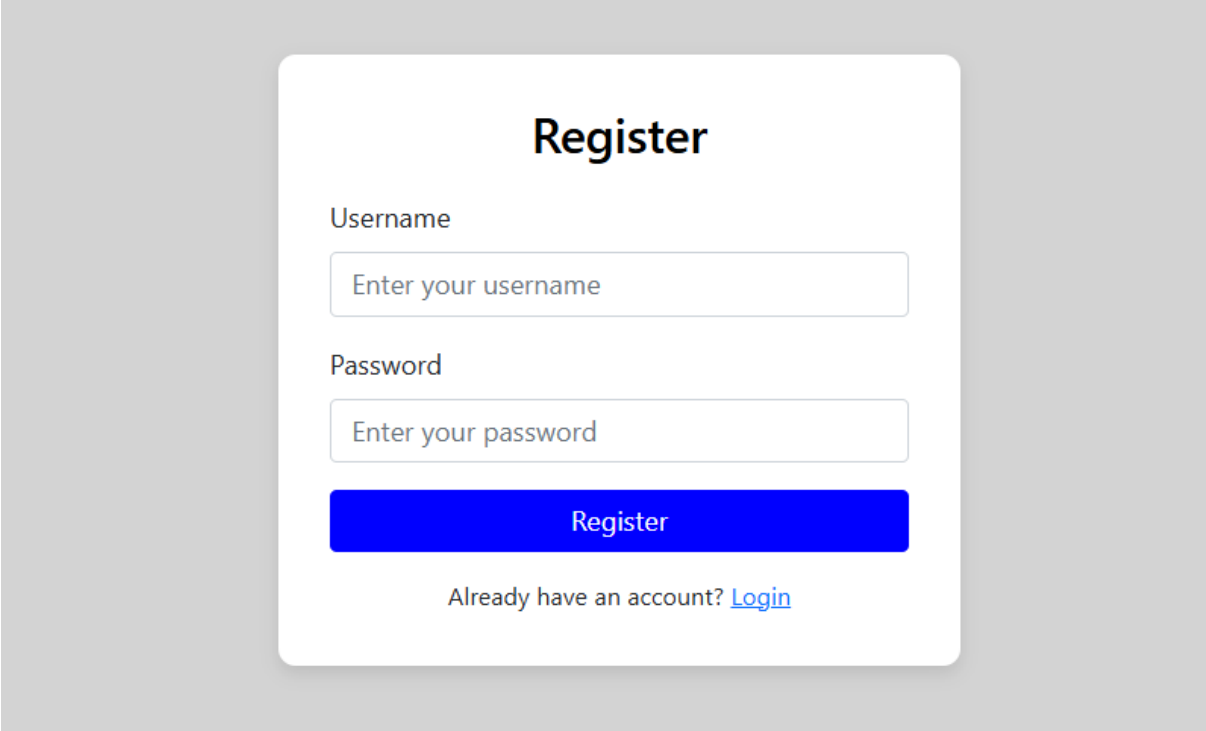


If the password or username is wrong, it will prompt Invalid username or password



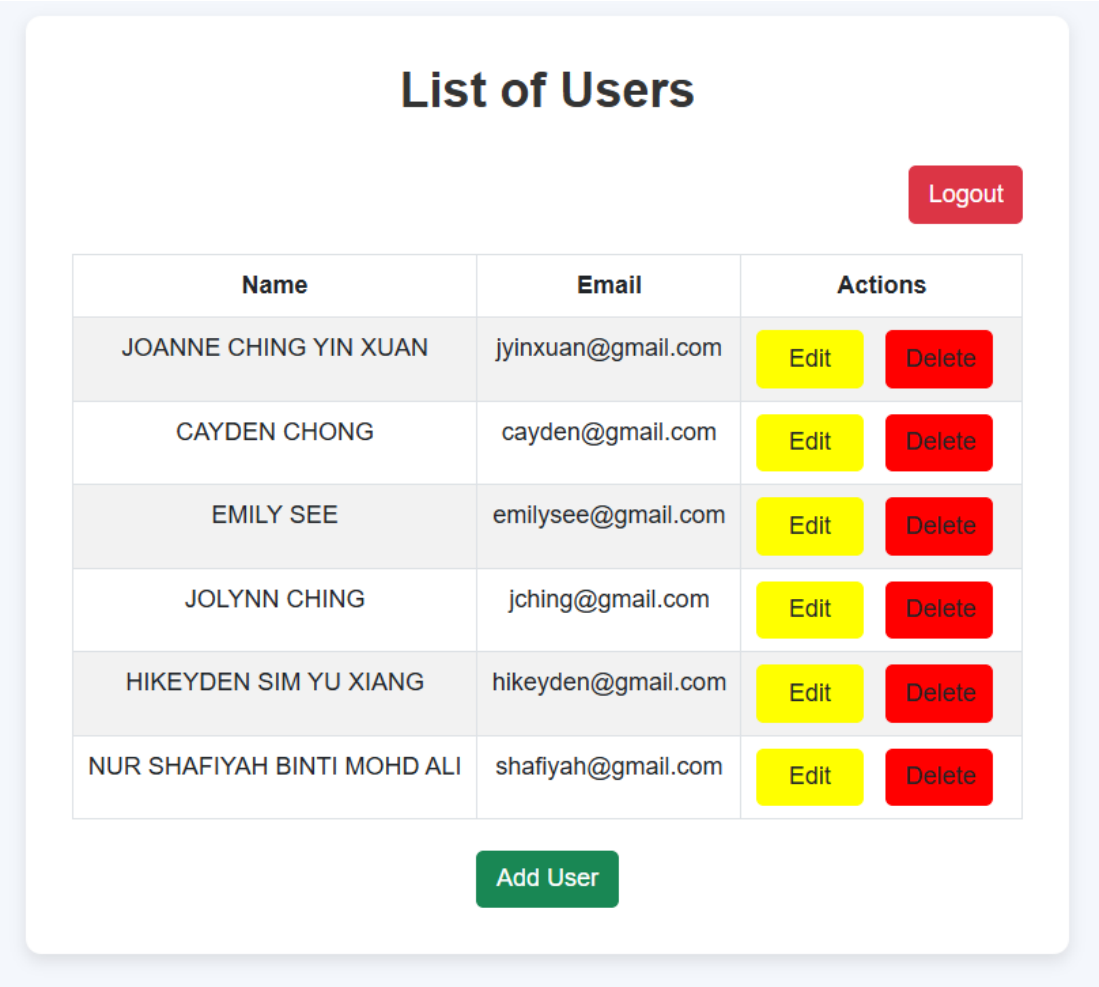
Register interface

If the admin is a new admin, the admin need to register an account with a username and password.After the admin successfully registers, the page will redirect back to the login, and the admin needs to type the log-in information to access the system.In this page we also contain Already have an account hits which can redirect back to Login page for admin that suddenly remember he or she already has an account.



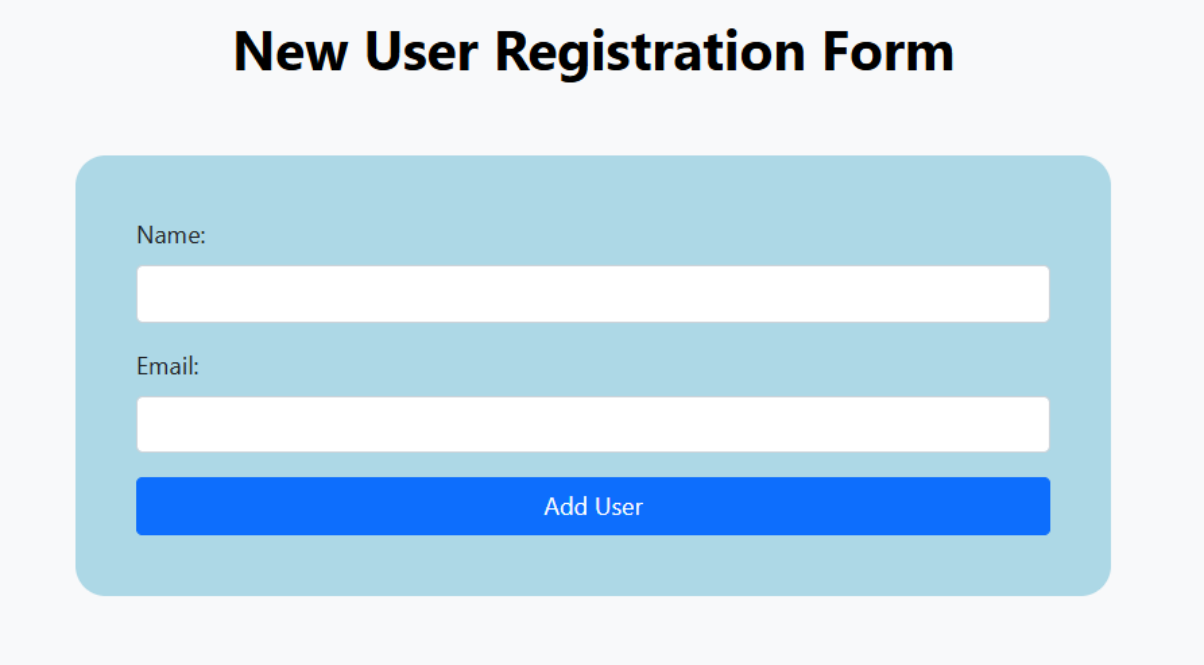
List of User interface

This interface contains all the user information of the system including Name, Email, and Action whether the admin can choose to edit or delete. Other than that, there is also an add user button that can create new users.There is also a log out button to log out the system.



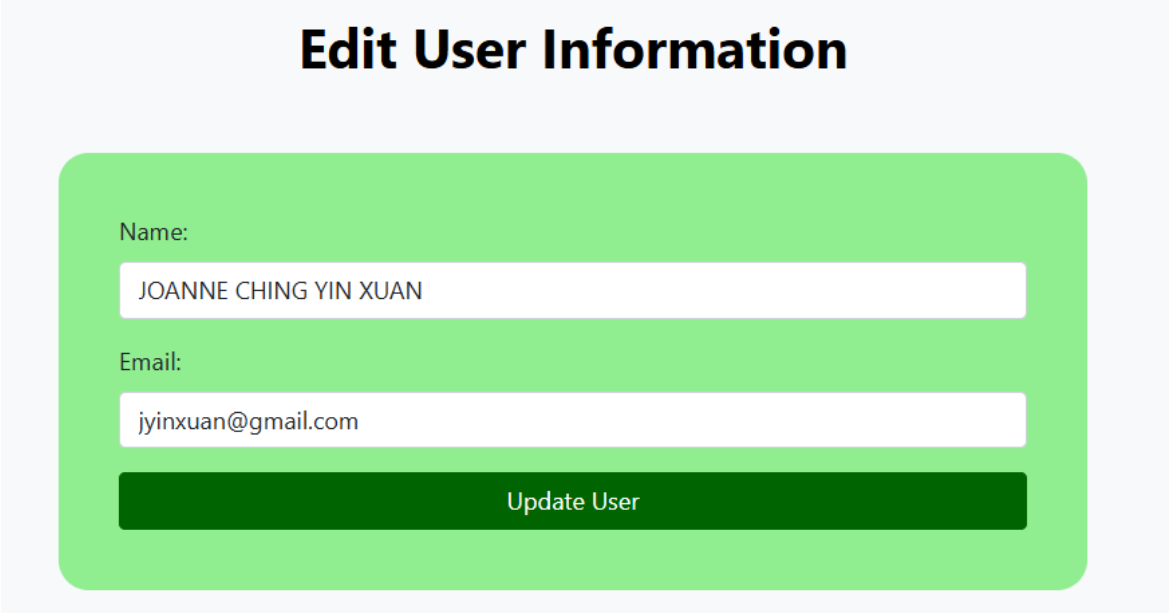
Create user interface

The interface shows that to create a new user need to key in the name and email. After clicking the Add User button, the page will redirect to The List of Users. Admin can check the list to spot errors.



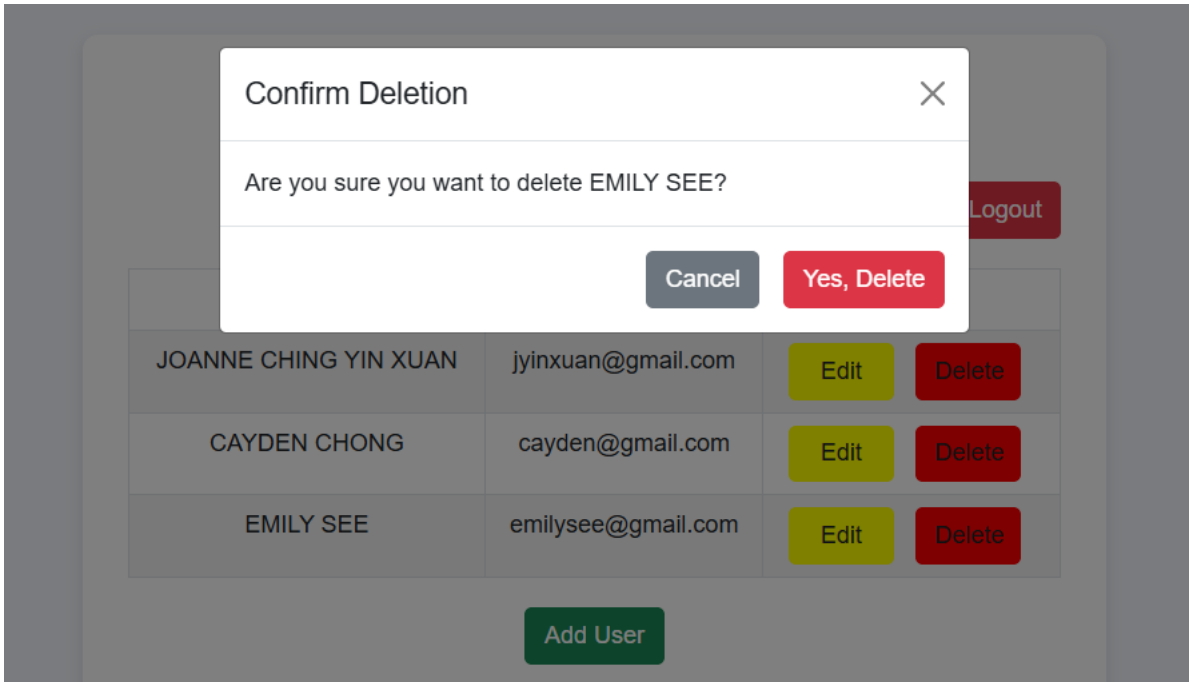
Edit User interface

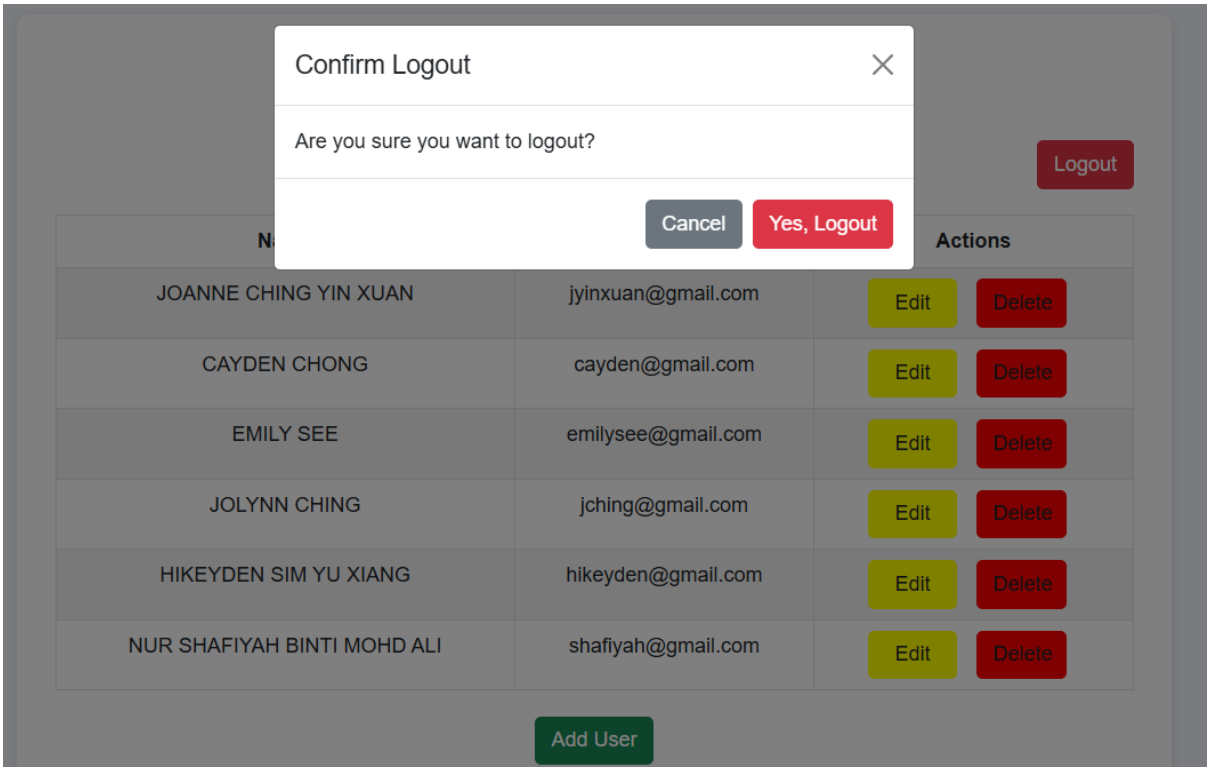
If there is an error admin can click on the Edit button In the List of Users interface so that admin can edit the users information.



Delete User interface

For deletion, the system is designed to prompt a delete confirmation to avoid admin accidentally deleting the info. If clicking Yes, Delete the system will delete the info, if clicking Cancel the system will retain the information.



Logout interface


The same goes for logging out..The system is designed to prompt a delete confirmation to avoid the admin accidentally logout
